

Current Data Model – How is it organized?

The screenshot shows the EASE-e Data Analyzer - EDW interface. The left sidebar lists various objects categorized into STATE STUDENT OBJECTS, STATE EDUCATOR OBJECTS, and STATE ORGANIZATION OBJECTS. Three callout boxes provide details on object relationships:

- Organization object** - The Organization object is the only object that can be queried with any other object in the EDW.
- State Student objects** – can only query with other student objects, the Organization object and Assessment objects
- State Educator objects** – can only query with other educator objects and with the Organization object.
- State Organization objects** – YRBS and Discipline data can only be mixed with attributes from Organization object.

The interface also shows a central area with a table structure and a bottom status bar indicating 'Ready.' and the user 'Bruce Donahue'.

It is important to understand that when you construct a query, only certain objects can be grouped together. See also color EDW graphic. You will not get any results if your objects are grouped incorrectly.
